The invention relates to an isolated insulin homologue zins4 having composition family. The zins4 gene, located on chromosome compositions as a lata amino acid protein, where the zins4 polypeptide 1913:11, encodes a 142 amino acid protein, where the zins4 polypeptide comprises a B chain and A chain comprising amino acid residues 26-52 and comprises a behain and A chain comprising amino acid residues 26-52 and comprises a betain a chain comprising and vasotropic activity. Zins4 has cytostatic, antifertility and vasotropic activity. Zins4 has cytostation in himmans and animals and in therapies for treating proteins are useful in applications for enhancing fertilisation during proteins are useful in treating suscell in treating reproductive assisted reproductive disorders and to identify cells, respect to the zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the contain syndrome and other reproductive function, ovulation, prostate, testicular cancer, fertility, ovarian function, ovulation, pathological conditions and only better the varian syndrome and other reproductive functions including concern the molecules are also useful for treating dysfunction associated concern the molecules are also useful for treating dysfunction, vivo, with contractile tissues or to suppress or enhance contractility in vivo, contractility in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 maturation of ovarian cells, myocytes, endothelial cells, osteoblasts in culture and in the study of the ovarian cycle, reproductive function, ovarian cell-cell interactions and fertilisation. The polypeptide is also useful as a modulator of blood pressure, muscle tension and osmotic balance. The zins4 polynucleotide is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        birth control, treating impotence or other male reproductive dysfunction, inducing birth, for promoting growth, differentiation, development and/or maturation of ovarian cells, myocytes, endothelial cells, osteoblasts in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 142 AA;

The present sequence is that of a murine paralog (see AAV95771) of munan zins3 (see AAV95770), a novel member of the insulin/relaxin cannot be munan zins3 (see AAV95770), a novel member of the insulin/relaxin cannot be made that more chromosome lassociated family member that maps to a region of human chromosome lassociated cannot be used converted (NIDDM). The sequence with non-insulin dependent diabetes mellitus (NIDDM). The sequence converted converted that mouse zins3 is expressed in chlots of embryo tissue indicated that mouse zins3 is expressed in chlots of embryo tissue indicated that mouse zins3 is expressed in collection of converted fashing. Zins3 polymorphisms that converted converted to a developmentally regulated fashing. In the human zins3 gene. The invention result from mutations in the human zins3 gene. The invention that provides methods for identifying abnormalities in expression that care a factor in causing, or predisposing, a person to some defect in glucose metabolism, such as NIDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               51; Indels 36; Gaps

The Zins3 protein is an insulin homologue protein. Polynucleotide using an expression vector. The cell will express an insulin homologue cusing an expression vector. The cell will express an insulin homologue polypeptide encoded by the polynucleotide. The polypeptides can also be conhuman animal. The polypeptides can be used to identify and isolate ceptors for zins3. Antibodies and antagonists of the polypeptides can be used for treating disease associated with the polypeptide, such as reproductive disorders can sesociated with the polypeptide, such as reproductive disorders can associated with the placenta and uterus, gastrointestinal diseases placental and colon pathology. Antagonists against the polypeptide may can be used to treat diseases such as preclampsia, premature labour, and

The Zins3 protein is an insulin homologue protein. Polynucleotide

CC molecules taken from its gene can be introduced into a cultured cell

cusing an expression vector. The cell will express an insulin homologue

CC polypeptide enroded by the polynucleotide. The polypeptides can also be

CC combuman animal. The polypeptides can be used to identify and isolate

CC receptors for zins3. Antibodies and antagonists of the polypeptides can

CC receptors for zins3. Antibodies and antagonists of the polypeptides can

CC receptorated with the polypeptide, such as reproductive disorders

CC associated with the polypeptide, such as reproductive disorders

CC associated with the placenta and uterus, gastrointestinal diseases, and

CC placental and colon pathology. Antagonists against the polypeptide may

CC also be used to treat diseases such as preclampsia, premature labour, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Insulin homologue polypeptide(s) and antagonists - used to, e.g. treat pre-eclampsia, premature labour and Crohn's disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an insulin-like polypeptide (pro-ILP). The protein is expressed in the colon and uterus, and is a member of the insulin/IGF family. The immature pro-ILP comprises a 135 maino of the insulin/IGF family. The immature pro-ILP comprises a 135 maino acid sequence, which is processed into the mature form which comprises and A chain and a brain linked by disulfide bonds. The C-peptide of pro-ILP exists as a separate peptide after processing of pro-ILP. The protein is useful in treatment of disorders related to ILP protein is useful in treatment of disorders related to ineurophysicological function affecting fluid homeostasis, electrolyte homeostasis, cardiovascular function, blood pressure, somatic or cardiac homeostasis, cardiovascular function, blood pressure, somatic or cardiac homeostasis, cardiovascular function, blood pressure, somatic or cardiac deposition. The methods can be used for diagnosing a physiologic or pathologic condition of the uterus, colon or other ILP-expressing cell pathologic condition of the uterus, colon or other ILP-expressing cell or tissue and for diagnosis and screening of modulators and therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Insulin-like polypeptide; pro-ILP; ILP; insulin/IGF family; A chain; B chain; C chain; neurophysiological function; fluid homeostasis; electrolyte homeostasis; cardiovascular function; blood pressure; somatic; cardiac innotropic activity; blood pressure; somatic; cardiac innotropic activity; cardiac chronotropic activity; collagen deposition.

Isolated PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptides

or their agonists (preferably anti-PRO agonist antibody or a small

conclecule minicking the biological activity of PRO polypeptide) are

compositions comprising the biological activity of propertide) are

compositions comprising the PRO polypeptides are useful for tunibility meoplastic cell growth and for treating cancer including

contral nervous system cancer, uterine, prostate, lung, bladder,

contral nervous system cancer, melanoma and leukaemia in a mammal.

con the PRO polypeptides are also useful for treating other disorders

controphagal, epithelial, strocytal, hypothalamic and other glandular,

controphagal, epithelial, strocytal, lastococlic disorders and

continued processing the properties and menunologic disorders as well as being

controlled with a candidate molecule and monitoring biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, PRO, promotion; inhibition; angiogenesis; cardiovascularisation;

The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing acadiovascular, endothelial or angiogenic disorder in mammals by acadiovascular, endothelial or angiogenic disorder in mammals by and for identifying agonists and antidonists of these processes. The conclete acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with anappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. ANAT/310 to ANAT/321 and associated with decreased PRO expression. ANAT/310 to ANAT/321 and associated with decreased rule exemplification of the present invention.

The present sequence is that of zins3, a novel member of the insulin/relaxin family. The zins3 gene maps to human chromosome to insulin/relaxin family. The zins3 gene maps to human chromosome plain, a region that is correlated to a heritable form of non-insulin dependent diabetes mellitus (NIDDM). Zins3 mRNA is not expressed in detectable amnounts in healthy tissue, indicating that the zins3 in diabilitus (NIDDM). Zins3 mQND corresponding that the zins3 polynucleotides and polypeptides can specialized cell type. Zins3 polynucleotides and polypeptides can be used to diagnose disorders associated with abnormal expression of the zins3 protein, and to identify polymorphisms that result corresponds in the zins3 gene. In particular, the invention from mutations in the zins3 gene. In particular, the invention corresponding are a factor in causing, or predisposing, a person to some defect are a factor in causing, or predisposing, a person to some defect are a factor in causing, or predisposing, a person to some defect are a factor in involves cleavage at the C-terminus of the signal proper in involves cleavage at the C-terminus of the members of the insulin family, cleavage at the C-terminus of the remaining mand at the N-terminus of the A-chain, resulting in the N-terminus of the A-chain, resulting in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               removal of the C-peptide. Cysteine residues at positions 29 and 41 (B-chain) and 121 and 125 (A-chain) are capable of associating through cysteine bridges and forming disulfide-bonded molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lok S;

5.
proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomator. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, foremsics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human secretory and transmembrane; PRO; mammalian; cancer; lung; breast; prostate; cervical; tumour necrosis factor-alpha; TNF-alpha; cartilage; ear; proliferation; glucose; free fatty acid; skeletal muscle; adipocyte; A-peptide; factor VIIA; gene therapy.

```
ANULI72-AAU12446 represent novel human secretory and transmembrane

PRO polypeptides. The PRO polypeptides are useful to detect other

PRO polypeptides, to link bloactive molecules to cells expressing

PRO polypeptides, to modulate biological activities of cells expressing

PRO polypeptides, and to detect the presence of mammalian lung, colon,

PRO polypeptide expression in a cell sample to that in a control sample.

Come of the 275 sequences are also useful to stimulate the release of

Common necrosis factor-alpha (TMF-alpha) from human blood, the to

Come of the 275 sequences are also useful to stimulate the release of

Common necrosis factor-alpha (TMF-alpha) from human blood, the to

Come of the 275 sequences are also useful to stimulate the release of

Common necrosis factor-alpha (TMF-alpha) from human blood, the to

Come of the proliferation of chondrocytes, the proliferation or

Confidence to the proliferation of inner ear utricular supporting cells of

Confidence (PBMCs), or the proliferation of endothelial cells. Some of

Monocytes (PBMCs), or the proliferation of endothelial cells. Some of

Confidence may modulate glucose or free fatty acid uptake by

Skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide

Confidence or wind to binding interactions. The polynuclectides encoding

PRO Polypeptides can be used to generate probes, antisense RNA/DNA,

Confidence or wind to animals and can be used in gene therapy.

The present sequence is that of PRO182 (UNQ156), a novel human continuous degree of protein encoded by cDNA (see AAF30052) isolated from a uterine cDNA library. The invention provides polynuclectides from a uterine cDNA library. The invention provides polynuclectides compositions comprising these proteins or including PRO182. Claimed compositions comprising these proteins or their agonists are useful for increasing infiltration of inflammatory comprising a tissue of a mammal, stimulating or enhancing an immune crepionse in a mammal, or increasing the proliferation of T-lymphocytes in a mammal in response to an antigen. Claimed compositions in effect. A claimed method for treating an immune related disorder, comprising the PRO polypeptide or its antagonist have the opposite composition as a T cell disorder, involves administering the PRO polypeptide, such as an antagonist antibody. The disorder is selected from systemic lupus erythematosus, rheumatoid arthritis, csteparthris, juvenile chronic arthritis, spondyloarthropathy, csteparthris, juvenile chronic arthritis, spondyloarthropathy, csteparthris, systemic vasculitis, sarcoldosis, autoimmune haemolytic systemic vasculitis, sarcoldosis, autoimmune thrombocytopeania, thyroiditis, diabetes mellitus, cameamia, autoimmune thrombocytopeania, thyroiditis, diabetes mellitus, circhosis, granulommatous hepatitis, sclerosing cholangitis, cc biliary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease (ulcerative colitis and Crohn's disease), cc gluten-sensitive enteropathy, Whipple's disease, (auto)immune—mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ashkenazi AJ, Baker KP, Fong S, Goddard A, Godowski PJ, Gurney AL;

The invention relates to novel human anglogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins additionally encompasses methods of identifying modulators of PRO comprising a PRO protein, agonists or antaqonists of a PRO protein, and additionally encompasses methods of identifying modulators of PRO expression or activity; diagnoshing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof. PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof. PRO nucleic acid; and methods of inhibitime or stimulating endothelial or angiogenic disorders, such as a cardiovascular, production of PRO proteins, as hybridisation probes to screen libraries to isolate colds are additionally useful in the recombinant production of PRO proteins, to analyse genetic disorders, and in a cold and penes encoding PRO proteins, to analyse genetic disorders, and in a penes encoding PRO proteins, to analyse genetic disorders, and and in therapy. PRO nucleic acids are algebrate production of processing and processing of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              animals useful for the development and screening of potential therapeutic agents. The present sequence represents a PRO protein of the

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-1- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are produced by alternative splicing.
-1- TISSUE SPECIFICITY: Expressed in the ovary during pregnancy. Also expressed in placenta, decidua and prostate.
-1- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                 MEDLINE-92241162; PubMed=1572287;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. /SIDS1/gcgdata/hold-geneseq/geneseqp-embl/AA2001.DAT

The invention relates to an isolated insulin homologue zins4 having homology to the relaxin family. The zins4 gene, located on chromosome comprises a 142 amino acid protein, where the Zins4 polypeptide comprises a behain and A chain comprising amino acid residues 26-52 and comprises a behain and A chain comprising amino acid residues 26-52 and 19-142 respectively, joined by inter- and intra-chain disulfide bonds. The state of the selection in applications for enhancing fertilisation during assisted reproduction in humans and animals and in therapies for treating reproductive disorders. Intex4 protein is useful in treating reproductive, prostate, heart or kidney disorders and to identify cells, tissues or cell lines which respond to the zins4-stimulated pathway and to identify inhibitors of its activity. Zins4 polypeptides and modulators of the polypeptide are useful in treating disorders associated with gonadal collypeptide are useful in treating disorders associated with gonadal development, pregnancy, pubertal changes, menopause, ovarian cancer, prostate, testicular cancer, fertility, ovarian function, ovulation, propostic ovarian syndrome and other reproductive functions including pathological conditions in ovary. Detection of zins4 polypeptides in the serious prostate is as a patient is useful for diagnosing ovarian concerned the molecules are also useful for treating dysfunction associated with contractile tissues or to suppress or enhance contractility in vivo, that however the molecules are also useful in treating cardiovascular disease, infertility, in vitro fertilization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        birth control, treating impotence or other male reproductive dysfunction, inducing birth, for promoting growth, differentiation, development and/or maturation of ovarian cells, myocytes, endothelial cells, osteoblasts in culture and in the study of the ovarian cycle, reproductive function, ovarian cell-cell interactions and fertilisation. The polypeptide is also useful as a modulator of blood pressure, muscle tension and osmotic balance. The zins4 polynucleotide is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New insulin homologue polypeptide having homology to relaxin family, designated zins4 and zins4 polynucleotide, useful for diagnosing, preventing, treating reproductive, prostate, heart and kidney disorders

associated with the polypeptide, such as reproductive disorders associated with the placent and uterus, gastrointestinal diseases, and placental and colon pathology. Antagonists against the polypeptide may also be used to treat diseases such as preclampsia, premature labour, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The Zins3 protein is an insulin homologue protein. Polynucleotide molecules taken from its gene can be introduced into a cultured cell using an expression vector. The cell will express an insulin homologue polypeptide encoded by the polynucleotide. The polypeptides can also be expressed by introducing the polynucleotides into the germline of a nonhuman animal. The polypeptides can be used to identify and isolate nonhuman animal. Antibodies and antagonists of the polypeptides can be used for treating disease associated with extracellular matrix and be used for treating disease associated with extracellular matrix and vessels. The antibodies may also be used in the diagnosis of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is that of a murine paralog (see AAY95771) of funnan 21ns3 (see AAY95770), a novel member of the insulin/relaxin family member that maps to a region of human chromosome 1 associated with non-insulin dependent diabetes mellitus (NIDDM). The sequence blots of embryo tissue indicated that mouse zins3 is expressed in a developmentally regulated fashion. Zins3 polynucleotides and a developmentally regulated fashion. Zins3 polynucleotides and abnormal expression of zins3, and to identify polynorphisms that result from mutations in the human zins3 gene. The invention considered a factor in causing, or predisposing, a person to some defect in glucose metabolism, such as NIDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes -

RRF-1 cDNA (AAY68418) was isolated in a search of displays all the expected features of a new insulin family member, expressed sequence tags for sequences related to relaxin. RRF-1 partic. with regard to a cluster of four cysteine residues at the Terminus of the molecule. A related placenta specific factor, in transformed host calls for use in the prepn. of antiboodies and the representation of a sequence of a sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in culture. RRF-1 may be involved in the maturation of sperm and may have a role in treatment of fertility disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      restis-specific insulin homologue poly:peptide(s) - may be used, e.g. in enhancing viability of cryo:preserved sperm, enhancing sperm motility or in immuno:contraception methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is human ZinsZ testis-specific insulin homologue, which may be used to enhance the viability of cryopreserved sperm, sperm motility, egg/sperm interactions, fertilisation or proliferation or differentiation of testicular immunocontraception methods to prevent fertilisation. Antagonists, e.g. anti-ZinsZ binding protein, may be used in contraception. ZinsZ is especially useful for in vitro fertilisation methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rat; Zins2; testis-specific insulin homologue; differentiation; cryopreserved sperm viability; sperm motility; proliferation; egg/sperm interaction; fertilisation; testicular cell; vaccine; immunocontraception; contraception; in vitro fertilisation.

                                                                                                                                                                                                                                                                                         Testis-specific insulin homologue poly:peptide(s) - may be used, e.g. in enhancing vlability of cryo:preserved sperm, enhancing sperm motility or in immuno:contraception methods
                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is rat Zins2 testis-specific insulin homologue, which may be used to enhance the viability of cryopreserved sperm, sperm motility, egg/sperm interactions, fertilisation or proliferation or differentiation of testicular immunocontraception methods to prevent fertilisation. Antagonists, e.g. anti-Zins2 binding protein, may be used in contraception. Zins2 is especially useful for in vitro fertilisation methods.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The inventors claim synthetic porcine preprorelaxin and prorelaxin and synthetic A, B and C peptide chains of prolaxin, and a gene for expression of porcine preprorelaxin or prorelaxin, and their subunits (see AAN30186). They also claim a double-stranded DNA fragment for the expression of the signal peptide chain of porcine preprorelaxin comprising a coding strand and a complementary strand corresp. to a defined mRNA sequence (see AAN30187-N30194) which corresp. to the most homologous regions between the pig and rat cDNA sequences. A probe (AAN30195) is also claimed.
                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                           The genes
                                                                                                                The inventors claim synthetic genes for porcine relaxin. The genes may contain, in addn to the coding sequence, a stop codon, an initiator methionine codon, restriction sites for Cla I and Bam HI etc. Porcine relaxin is useful in the induction and control of labour in women. In sows admin. during farrowing may reduce the rate of still birth of piglets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genes and DNA transfer vectors for prorelaxin expression - useful
in prodm. of porcine relaxin for veterinary and human use
                                                                                                                                                                                                                                                                                                         ;

The ILP protein is expressed in the colon and uterus, and is a member of the insulin/TGF family. The immature pro-ILP comprises a 135 amino acid sequence, which is processed into the mature form which comprises an A chain and a B chain linked by disulfide bonds. The CPEPtide of pro-ILP syststs as a separate peptide after processing of pro-ILP. The ILP protein is useful in treatment of disorders related to meurophysiological function affecting fluid homeostasis, electrolyte concestasis, cardiovascular function, blood pressure, somatic or cardiac innortopic activity, cardiac chronitopic activity and collagen concessing pathologic condition of the uterus, colon or other ILP-expressing cell pathologic condition of the uterus, colon or other ILP-expressing cell content the present sequence does not appear in the specification; it was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

associated with the polypeptide, such as reproductive disorders associated with the polypeptide, such as reproductive disorders associated with the placente and uterus, gastrointestinal diseases, and placental and colon pathology. Antagonists against the polypeptide may also be used to treat diseases such as preclampsia, premature labour, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              molecules taken from its gener can be introduced into a cultured cell using an expression vector. The cell will express an insulin homologue bolypeeptide encoded by the polymucleotide. The polypeptides can also be expressed by introducting the polymucleotides into the germine of a nonhuman animal. The polypeptides can be used to identify and isolate receptors for zins3. Antibodies and antagonists of the polypeptides can be used for treating disease associated with extracellular matrix and vessels. The antibodies may also be used in the diagnosis of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Insulin homologue polypeptide(s) and antagonists - used to, e.g. treat pre-eclampsia, premature labour and Crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;
